### ABSTRACT

Person-Centered Medicine, considered by many authors as a new clinical method, has gained space in the Brazilian context of health education. However, its practice has not been widespread in its formal model. The present work was conceived with the objective of raising in literature the applicability of the Person-Centered Clinical Method and of investigating how the person-centered health care affects the quality of care and the clinical practice of students and health professionals.

**KEYWORDS:** person-centered clinical method, person-centered medicine, patient-centered care, medical education.
